

Thrucare

Overview

Patient's easy access to nearby services like doctors, chemists and medicine stores was the main objective. We were required to build an online video consultancy and paper-less product having doctor and patient data with unique IDs.

Challenges

- To make the case study from every user perspective
- The kind of data that needs to be available for seamless access by the user
- To accommodate various service providers for multiple role management
- Exact status of emergency services availability at various health care centres

Technologies Used

- Android & iOS
- React.js, Node.js, Java
- Swift
- Redux

Solutions

- Interviewing patients and doctors about the problems for having a surveyed analysis of user perspectives
- User flow designs were made based on role researches
- Listing of roles and positions for degree of access to be given on the application
- Portal has been provided to the organizations for updating the real time status of emergency services
