

Dubverse

AI Voiceover and subtitle generation platform.

Project Duration

6 months

Designers

Abinash

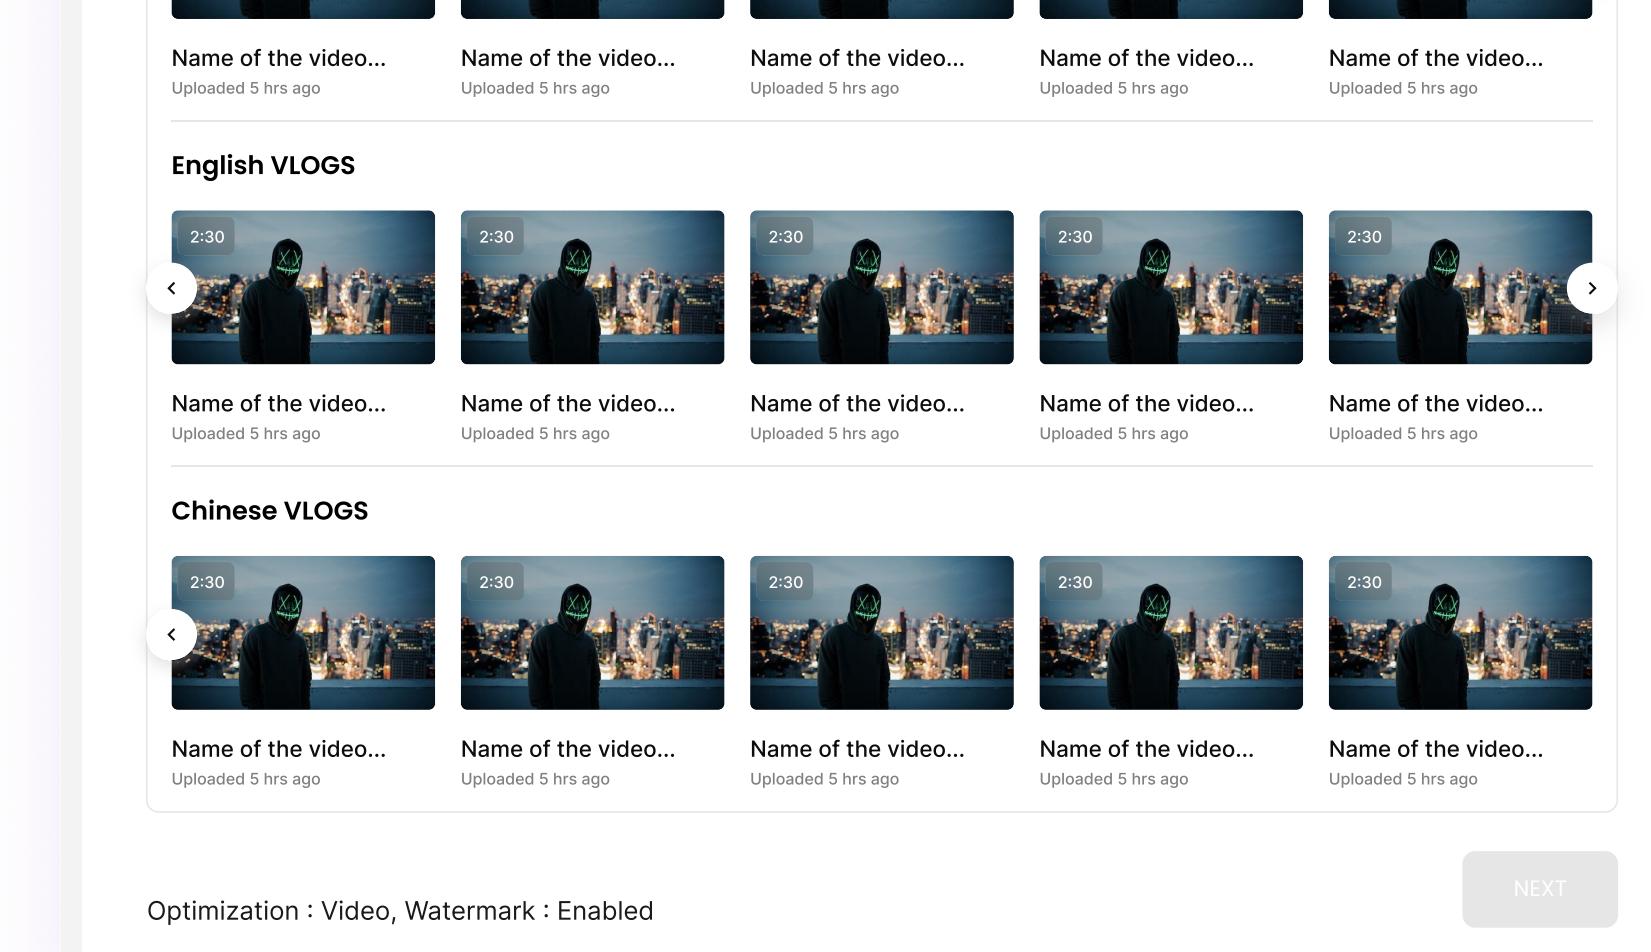

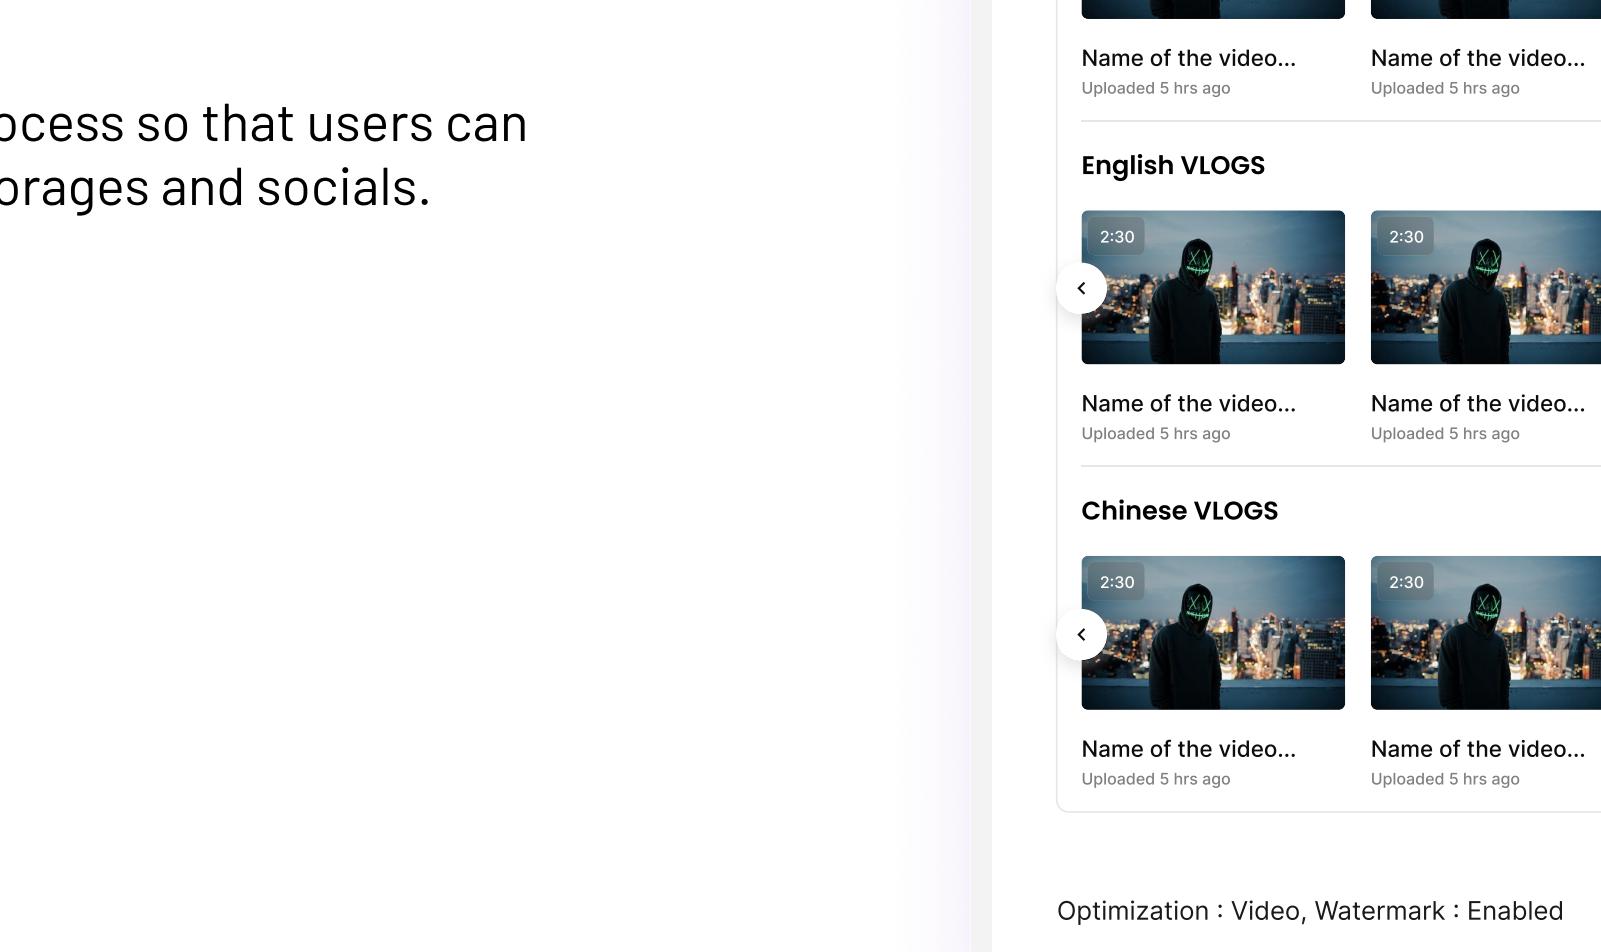

About Project

Dubverse is an online platform where users can Dub a video, generate subtitles and convert text to speech with the power of AI. The main target audience of the platform are content creators and media agencies so that they can make their content multi-lingual using AI technology.

The Challenges

Even though the technology behind generating voice and text with the power of AI is very exciting and captivating to a lot of people, the main challenge of Dubverse was how to turn that complexity into an effortless user experience.

Our primary focus was on designing an intuitive dashboard that would be effortlessly navigable and understandable for all types of users, regardless of their backgrounds. Through user-centric approaches, we successfully overcame this challenge, ensuring that the users are able to perform the main tasks of the platform and is educated with the process as well.

We started with the sign up and onboarding screens, added guided navigation for first time users.

Added new subscription model for advance users and ensured that people understand the benefits of the added subscription.

Revamped the video addition process so that users can also add videos from multiple storages and socials.

The Solution

We started with the sign up and onboarding screens, added guided navigation for first time users.
